

NEXTCARE MX

BUILD CHAT & EVIDENCE

Condensed record of decisions, implementation, and verification

Business Bending - Week 5

Student: Emiliano Carballido | Lens: Technologist

FICTIONAL DEMO | NAVIGATION SUPPORT ONLY | NOT MEDICAL ADVICE

Purpose of this record

This document summarizes the substantive build conversation and repository evidence for the Week 5 submission. It is a concise, readable build record rather than a claim that every intermediate message is reproduced verbatim.

Prompt distilled from the assignment

Build a smallest working slice that honors the Week 5 Blueprint: fictional data only; no symptom checker or diagnosis; an accountable structured handoff; simulated AI clearly labeled; automation stops after two unsuccessful attempts; a human navigator can accept ownership; acceptance remains unresolved.

Key product decisions

- Chose the navigation vacuum instead of improving diagnostic accuracy.
- Started with an existing provider-approved abnormal retinal screening.
- Used handoff state as the structured signal.
- Used no database and no API key to minimize privacy and security risk.
- Labeled all AI text as simulated.
- Reserved diagnosis, urgency, next medical action, and treatment for clinicians.

Implementation record

Commit	Evidence
4da530d	Product packet committed before implementation
5648d13	Static NextCare MX interface
a96a4e7	Responsive navigation-dashboard styling
ec85c68	Structured handoff and escalation logic
e31e43d	Runnable prototype package
da79a35	Mechanical acceptance checks
45b226d	Session decisions documented
3369638	Mechanical pass, bug, and fix documented
29708b8	Persona walkthrough and usability fix
8cf35b7	Generated mockup documented in packet

Mechanical verification

Check	Result
Fictional demo label	PASS

Check	Result
Clinical boundary	PASS
Owner field	PASS
Deadline field	PASS
Barrier field	PASS
Two-attempt escalation rule	PASS
Unresolved human acceptance	PASS
Simulated AI label	PASS

Manual scenario

- Initial attempts = 0.
- First failed contact increments attempts to 1; automation remains available.
- Second failed contact increments attempts to 2; automation stops and HUMAN REVIEW REQUIRED appears.
- Navigator accepts the case; ACCEPTED - STILL UNRESOLVED appears.

Bug and fix

Review found that the barrier selector could change after a human navigator accepted the case, allowing the escalation context to drift after ownership changed. The selector now locks after acceptance, while the interface keeps the unresolved-state explanation visible.

Persona-driven usability correction

The largest confusion was that human acceptance might sound like completed care. The final interface uses ACCEPTED - STILL UNRESOLVED and explains the exact closing events. It does not promise an appointment, coverage, affordability, or treatment.

Repository and run details

Repository: EmilianoCarballido-builds/Smart-business. Branch: week5-nextcare. App root: nextcare-week5. The prototype is plain HTML, CSS, and JavaScript, so it can run as a static site with no build step. The original remote branch was audited without modification for this delivery package.

Remaining manual evidence

The student must record DEMO_EmilianoCarballido.mp4 using the prepared script and must open/copy the live deployment URL after deployment. Those actions require the student's voice or access to the hosting interface and cannot be honestly fabricated.
