PERSONA TEST

Synthetic walkthrough and usability correction

Business Bending - Week 5

Student: Emiliano Carballido | Lens: Technologist

FICTIONAL DEMO | NAVIGATION SUPPORT ONLY | NOT MEDICAL ADVICE

Test persona

Lucía is a fictional 55-year-old informal worker in Mexico. She mainly uses WhatsApp, reads slowly when stressed, worries about losing work hours, and distrusts apps that sound as if they are making medical decisions for her.

Method

A synthetic persona walkthrough examined the complete prototype path: initial case, barrier context, first unsuccessful attempt, second unsuccessful attempt, required human review, and navigator acceptance. The review focused on comprehension, trust, honest status, and the clinical boundary.

Observations

Observation	Implication
'Abnormal retinal screening' feels frightening.	Immediately state that the result is not a diagnosis.
'Next action' is clearer than 'care pathway.'	Use direct action language.
Transportation is understood as the concrete blocker.	Separate access barriers from medical findings.
'Human escalation' sounds technical.	Say that a navigator will review the case.
Acceptance may sound like a guaranteed appointment.	State explicitly that ownership does not equal resolution, access, or coverage.

Worst confusion

Human navigator acceptance could be interpreted as: *the problem is solved*.

Correction implemented

The accepted navigator state now reads ACCEPTED - STILL UNRESOLVED. A persistent note explains that acceptance means a human owns the handoff; it does not confirm the clinical next action. The case stays unresolved until an approved action is confirmed, a clinician redirects it, or the patient makes an informed opt-out.

Verification after correction

- The two-attempt limit still triggers HUMAN REVIEW REQUIRED.
- The automated-attempt button remains disabled after escalation.
- The barrier selector locks after navigator acceptance so escalation context cannot drift.
- The clinical boundary and fictional-demo warning stay visible.
- The final state remains unresolved and does not use a misleading success color or claim.

Result

The strongest usability risk was addressed without expanding the product into diagnosis or promising healthcare capacity. The revised interface makes ownership visible while keeping the unresolved outcome honest.
